Seamlessly connect your IQ Retail system with other software applications

Using our API, connect your specialist software with your IQ Retail system quickly and efficiently.

What does the IQ Retail API actually do?

API – Application Programming Interface

Gone are the days of multiple systems that operate independently from each other.

If you are still using manual processes or outdated systems, it's time for a change. Change, as we know, is not always easy. Sometimes a business might have legacy systems in place which may not be on the cards to change right away for various reasons, but some other operational processes might not be able to afford the wait. This often leaves the likes of distributors and wholesalers in a difficult position.

It needn't be a make or break situation. An Application Programming Interface (API) can help your business to overcome this problem by connecting independent systems or applications with each other.

Once an API has connected or integrated different systems - like a mobile solution, third-party system, or ecommerce platform for example - it enables them to communicate with each other and work together.

The API enables users to look up the latest product details and pricing, generate sales orders, create quotes and invoices, process payments, manage purchases and much more via an ecommerce platform, mobile solution or third-party application, allowing specific data to flow to and from the IQ Retail system.

Key trading features:

By integrating our API with any of the IQ Retail systems and a third-party system, you can

- Cater for both Business-to-Consumer (B2C) and Business-to-Business (B2B) e-tailing methodologies

- Retrieve customer and supplier master details

- Retrieve customer selling prices, including contract prices

- Process customer quotations, sales orders, purchase orders, job cards, transfers, and payments via another solution

- Process account and cash sale invoices and credit notes

- Process cash and account payments

- Convert sales orders to invoices

- Access and update customer loyalty schemes

- Retrieve stock available on-hand values for each of your branches

- Retrieve active promotions

- Retrieve sales reps' and stock details with images

IQ Retail API at a glance

- Ecommerce integration between different platforms

- Real time updates on your BI information

- Facilitates data extraction

- Automation of process flows where there is more than one software application in place

- Integration in to third party products

- Facilitates both B2C and B2B integrations
